APPENDIX B: UNIT COSTS & CHARACTERISTICS **15**

Introduction

The year is 1948. The former Allies—the Soviet Union, the United Kingdom, and the United States—preside victorious over a shattered Central Europe. In the Pacific, the defeat of the Empire of Japan has left the island groping to recover from ten years of war and the devastating impact of two atomic bombs. Factories in the former Axis territories have been pounded to rubble by ceaseless Allied air strikes, and the political map of the world has been altered by the new world order.

Unfortunately, the post-war peace is fragile. The Union of Soviet Socialist Republics (USSR), seeking a just reward for its tens of millions of dead soldiers, moves swiftly to shore up territory gained during the war. Poland, Czechoslovakia, and North Korea are reconstructed under Communist rule. Feeling increasingly alienated from its former allies to the west, the USSR refuses to part with the eastern portion of occupied Germany, setting up a separate government loyal to Soviet doctrine. The Red Army, millions strong during the dying days of the war, maintains a harsh grip on the whole of Eastern Europe. Paranoid that the nuclear fires unleashed on Japan may be turned on Moscow, the Communist leaders push for new technology, aided by captured German scientists and equipment.

Western Europe has attempted to plot a different course. With the recollection of harsh dictatorships fresh in the minds of the political leaders, France, West Germany, and the United Kingdom begin to reintroduce democracy and citizen rule in the place of Nazi authority and occupation armies. Aware of the rising tensions with the Soviet Union, however, these nations band together with the United States to form the North Atlantic Treaty Organization (NATO) as an attempt to deter the mighty Soviet forces massing nearby. None of these nations have forgotten Russia's complicity with Germany early in the war.

The United States (US), brought painfully out from its traditional isolationism by the attack on Pearl Harbor in 1941, has now assumed a leadership role in the world. None of World War Two was fought on American soil; therefore, American factories and ingenuity have flourished, becoming leaders in industry and technology (although still less accomplished than Germany at its height). The US now holds a "nuclear monopoly," being the only nation with capacity to build and deliver the incredibly expensive yet powerful atomic bomb. However, as newsreels bring home the hellish devastation wrought by these weapons on the Japanese civilians, popular opinion in the US has started to turn against the use of nuclear devices in war.

Other regions of the world have reorganized following the conflict. China is locked in civil war between the corrupt and autocratic Nationalists and the Communists, who are steadily gaining control of the massive country. The Middle East has broken European control, and has pledged to a new unity in the wake of foreign leadership. India and Pakistan are negotiating independence, and the distant stirrings of revolution threaten colonial French and English territories in Asia and Africa.

"East and West" pits the nations of the NATO alliance against an all-out Soviet invasion of Europe and Asia, triggered by the tensions of the siege of Berlin. NATO players should attempt to hold off the Russian advance until superior economic and technical prowess can turn the tide. The Warsaw Pact player must concentrate on securing Europe while realizing the long-held Soviet dream of a "warm water port" on the Indian Ocean.

"Study history, study history. In history lie all the secrets of statecraft."—Winston Churchill

The Participants

Play consists of conflict between the Soviet-dominated nations of Eurasia, controlled by a single player; and the NATO alliance, consisting of the United States, Britain, and Western Europe, controlled by one, two, or three players. If only two play NATO powers, we suggest that a single player command Britain and Western Europe.

Several neutral alliances also figure in game play. These consist of groups of neutral territories which will react to outside circumstances as a unit. The neutral alliances are: China (shaded in blue), the Arab League (shaded in yellow), and the Organization of American States (shaded in purple).

The Soviet Union: The Soviet Empire in 1948 consisted of Russia, Eastern European satellite states, and several Asian "Soviet Socialist Republics." Additionally, Mongolia was ruled by a Communist regime closely allied with the USSR.

Britain: Although the vast British Empire declined rapidly in the post-war years, English influence extended to countries around the globe, especially in India, Pakistan, and sub-Saharan Africa.

Western Europe and Allies: United by the common threat of the USSR, many European countries opted to join the NATO alliance. Included under the umbrella of this alliance were France, West Germany, Italy, Turkey, Greece, Portugal, and others. Iceland also favored NATO (and formally joined in 1950), allowing US and British troops to heavily garrison the island.

"I have come to the conclusion that politics is too serious a matter to be left to the politicians."--Charles de Gaulle

The United States: Following in Britain's footsteps, the US established itself as a world superpower following World War Two. In addition to boasting the richest population in the world, the US had the densest industrial base. Important US allies included Panama, the Philippines, and South Korea. A wartime deal with Denmark provided for a US presence in Greenland. Japan was heavily occupied and actually governed by the US military for five years after the end of World War Two.

China: Racked by internal turmoil in the years following the war, China did not at first participate in global politics. Eventually, by virtue of its enormous population, it established itself as a regional leader, influencing and supporting nearby governments.

The Arab League: Free from European colonial government after the war, several countries in the Middle East formed an alliance in an attempt to increase their influence. Suspicious of both NATO and the Warsaw Pact, these nations are characterized by fierce nationalism and somewhat anachronistic leadership in the form of autocratic kings and sultans.

The Organization of American States: With the world's attention directed at Europe, the countries of South and Central America quietly began working towards a common goal of self-betterment. These nations often provided battlefields for the ideologies of the struggle between NATO and the Warsaw Pact—many saw the emergence of Communist insurgencies and reactionary military dictatorships.

Playing the Game

The board consists of a map of the world centered on Eurasia. The map is broken into various empires, denoted by color, and further subdivided into territories. Each territory has a certain value in credits, denoted by a number on the territory. Territories without numbers have no credit value. Before the game begins, players place units as described in the tables at the end of this manual. The bank pays income to each player equal to the value of all combined territories—the USSR receives 48 credits, the US receives 43, Britain receives 33, and Western Europe receives 32.

Play begins with the Soviet Union, and passes "east to west:" the Western European Alliance, the United Kingdom, and the United States. Each player must complete all phases of a turn before play passes onward. A "round" constitutes a turn by all four players.

Phases in a Turn

1) Spying
2) Technical Advancement
3) Unit Purchase
4) Combat Move
5) Combat
6) Non-combat
7) Unit Placement
8) Collection of Income

Spying: If a player has a spy on the board, he or she may place the spy (represented by an infantry unit) into one of the three divisions of the Spying Table at the bottom right of the map. The NATO players are allowed one spy each, and the Soviet Union may have up to two spies. In addition, the Soviet player may roll a free Counter-Espionage attempt during this phase.

Technical Advancement: Players may choose to spend 5 credits to attempt an advance in technology. If an advance is scored, it immediately upgrades all units currently on the board. This does not apply to heavy tanks or self-propelled artillery—these units must be built separately.

Unit Purchase: Anticipating future needs, players pick out the units of their choice in this phase. Unlike in the real world, deficit spending is *not* allowed. Leftover credits can be saved for use in subsequent rounds.

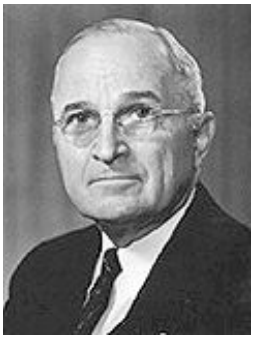
Combat Move: All battles must be declared prior any fighting. Before any dice are rolled, the attacking player declares which territories he intends to invade and then moves troops into these spaces. Aircraft carriers may not be moved forward to launch their planes unless they are actually attacking an enemy fleet. Armored units may

overrun (or "blitz") unoccupied enemy territories and continue onward to join combat elsewhere.

Combat: Combat involves several separate actions. The attacker and defender remove their units from the main board and line them up according to their value. The attacker rolls a die for each unit; a number less than or equal to the attack value scores a hit. At the end of the attacker's turn, the defending player removes a unit of his choice for each hit scored. These units are designated as "casualties," a convention allowing defending units to roll a counterstrike before they are removed completely. The defender then rolls for each of his units. Each hit forces the attacker to choose a unit to remove permanently from play. Combat is repeated until the attacker decides to withdraw (*before* attacking).

Example: The Soviet Union plans to attack Greece. To ensure victory, the Soviet commander moves all tanks and infantry from both Romania and Yugoslavia, along with one tank and the fighter from East Germany. Once all other battles have been similarly declared, the opponents remove their forces from the board. The Soviet player places his eight infantry in one stack (attacking at a "1") and the five tanks and the fighter in a second stack (attacking at a "3"). The Western European player also makes two stacks of units, placing the infantry and tank in one area (defending at a "2") and the plane in another (defending at a "4").

On round one, the Soviet player tosses eight dice for his infantry and rolls two "1s." With the tanks and plane he rolls a "1," a "3," two "4s" and two "6s"…two more hits. The defender moves all four infantry to a casualty area, and then counterattacks. He scores a total of three hits. The USSR player chooses to remove three infantry, and all of the defender's casualties are removed from play. The opponents may now begin the second round of combat.



"I was the only calm one in the house. You see I've been shot at by experts."—Harry S. Truman (after a 1950 assassination attempt)

Non-combat: Air and land units which have not exhausted movement points may now move into any friendly territory within range. **Air and land units may move during both combat and non-combat if they have movement points remaining**. Because they cannot land in newly captured territories, fighters and bombers must use any remaining movement to land in a friendly territory.

Example: Soviet forces have captured Greece, and all combat has been concluded. The fighter must now land. After flying two spaces from East Germany, it now has two spaces to find a friendly airstrip. It may therefore land in Yugoslavia, Romania, East Germany, Poland, or the Ukraine. Further, the Soviet player must decide the final destinations of his armored units. Because they each moved only one space in the combat phase, the tanks now have the option to stay in Greece or move back to either Yugoslavia or Romania. On the other hand, the tank from East Germany has already moved two spaces, and therefore must remain in Greece until the next round.

Unit Placement: During this phase, players place all purchased units on the map. Except for infantry, new units must be placed at industrial complexes. The maximum number of new units is determined by the value of the territory containing the factory: for example, the industrial complex in Italy may build up to four new units per turn.

Infantry are placed separately from other units. They may be placed on any territory, with a maximum up to the value of the territory. For example, the Western European player may build four infantry per turn in Italy in addition to any other units placed at the factory, but he may only build one infantry per turn in New Guinea. The final result allows the Western European player to place up to eight total infantry on Italy (four from the factory and four from the value of the territory), or seven infantry and one other unit, etc.

New industrial complexes may be placed in any territory that doesn't already have one. They do not interfere with the placement of other units as noted above. Newly captured or newly built industrial complexes may not be used to create units until the round after they are acquired.

Spies are placed in the "Spying" area at the corner of the board.

Collection of Income: Upon completing all other phases, the player adds the values of every territory under his or her control, plus any income from the neutral alliances. The bank then issues the total amount in credits for use the following turn.

Victory Conditions

The game ends when one of the following conditions is met at the end of a round (i.e. all four players have moved):

- The USSR controls Washington, D.C. and **either** London or Paris.
- The USSR has a combined income, including neutral contributions, of 90 credits.
- The NATO players have reduced the Soviet Union to a total income of less than 15 credits **and** have captured Moscow.
- Either side surrenders.

Capital territories have no significance in the game except as noted above.

Units

Ground Units

Infantry: Troops are the backbone of any army. Infantry units can move one space (territory) per turn, either on combat or non-combat. Two infantry may be loaded on a transport, or one may be carried aboard a bomber as a paratrooper.

Armor: The cavalry units of the twentieth century, tanks provide mobility and heavy firepower to support infantry. Armored units may move two spaces in combat or non-combat. Armor may *blitz* unoccupied enemy territories during the combat move, moving through these spaces, capturing them, and moving again to another combat.

Heavy Armor: Larger and better armored than standard armored units, heavy tanks are fearsome weapons. These are available only after the appropriate technology has been discovered.

Anti-Aircraft Guns: AA guns provide the only defense against strategic bombing, and act as a deterrent to enemy air forces. Prior to the first round of combat, the defender rolls one die for each attacking air unit; for each "1" rolled, the attacker must choose an air casualty. Aircraft hit by AA fire do not participate in the attack in any way. If a territory housing an AA gun is captured, the AA gun is captured as well. **Anti-aircraft guns may be modified with technology to anti-tank guns**.

Self-Propelled Artillery: Able to keep pace with the rapid advance of armor units and troop transports, SPA provide heavy fire support in forward locations on the battlefield. These units cannot be captured in combat; they are merely destroyed if hit. Further, they participate in each round of combat, just like other units.

Sea Units

Battleships: Acting as giant floating fortresses, battleships provide heavy artillery support to invading marines as well as controlling the seas.

While performing an amphibious assault, a player may include a battleship for support if the ship has not already participated in combat. Before any other rolls, the attacking player rolls one die for each bombarding battleship and inflicts one casualty for every "four" or less rolled. Units hit by the battleship may not fire back. Battleships may perform this strike on the first round of combat only.

The heavy armor and massive structures of battleships allow them a unique advantage. A battleship must be struck twice in combat before sinking. A battleship struck once may not attack again until repaired at a coastal factory for a cost of 10 credits. The wounded ship defends and moves as usual.

Aircraft Carriers: As the range and versatility of fighters improved, the United States and its allies relied increasingly on aircraft carriers as a means of supporting troops in hostile territory. The most complex vessels ever built, modern carriers require over five thousand sailors to operate at full capacity.

One or two fighters may land on each carrier. When taking off from a carrier, fighters **do not** count the sea zone of departure in calculating range. Similarly, when landing on a carrier, fighters **do not** count the sea zone containing the carrier.

Example: The American player wishes to assault Kamchatka. As part of the invasion force, a fighter takes off from the carrier stationed in Japan. The fighter flies north, counting the Sea of Okotsk as the first space, and the flight into Kamchatka as the second. If the fighter survives combat, it may return to the carrier with its remaining two moves.

Submarines: During the years following World War Two, submarines assumed a primary role in the armadas of the Soviet and NATO forces. While other classes of ships remained essentially unchanged over the next forty years, submersible vessels quickly evolved into vehicles for ballistic missiles, elite diving and salvage teams, and underwater surveillance.

Properties of submarines:

- They may only attack other ships. Aircraft cannot be shot down by subs.
- They are entitled to a "first strike"—attacks for submarines are resolved before any other combat rolls. Casualties of sub attacks are not entitled to a counter-attack. This occurs on each round of combat.
- When defending or attacking, any submarine surviving to the end of a round of combat may opt out of combat by either retreating to an adjacent sea zone or "submerging" (remaining in the same sea zone without engaging in further combat.)

Transports: Well-coordinated amphibious landings require the effective use of troop transports. The Inchon landing in the Korean War was a decisive turning point for US forces, allowing them to escape the Pusan perimeter and turn back the tide of the North Korean Army.

Transports may carry two infantry **or** one armored unit (tank, heavy tank, AA gun, or self-propelled artillery) **or** one nuclear bomb. If used in an amphibious assault, transports may not be moved further in that turn. They may pick up troops in two different territories for either combat or non-combat movement, and during non-combat they may drop off troops into two different territories.

Cruisers: Cruisers are versatile ships, capable of defending a fleet or participating in an amphibious assault. Because they can be manufactured at a fraction of the cost

of a battleship, cruisers have replaced the latter in modern navies.

Cruisers may provide support fire in a manner identical to the battleship, as listed above, except that they attack at a "2." One hit destroys a cruiser.

Air Units

Fighters: Quick and versatile, fighters can provide support to other units on land or at sea. They may be augmented with **jet propulsion**, **extended range**, or **troop-carrying capacity** (as helicopters). Fighters may land on carriers; they may not land in newly captured territories.

Bombers: Unsurpassed in attack strength and range, bombers are extremely vulnerable if caught on the ground. Bombers have several uses in addition to their direct combat role:

Paratroopers: Each bomber may shuttle one infantry directly to a battle. The bomber may not participate in combat, and is still subject to AA fire.

Strategic Bombing: Bombers may attack enemy industrial complexes directly. If AA fire is avoided, the target country must roll a die and return that number of credits to the bank.

Nuclear Weapons: A bomber must be used to deliver a nuclear weapon to its target. If AA fire is avoided and the bomb is dropped properly, the bomber must still roll a die to successfully escape the blast. If a "1" is rolled, the bomber is lost in the mushroom cloud.

Atomic Bombs: Nuclear weapons are extremely expensive and require special expertise to design and maintain. However, if used properly, they are devastating to the target. The attacking player may target any territory, land or sea, for the atomic bomb. The steps for delivering a nuclear device are as follows:

The attacker must have the **fission bomb** technology.
The attacker builds a bomb on his "Purchase Units" phase.
On his next turn, he may either move the bomb one space during non-combat only, or he may move it by bomber in combat or non-combat.
If attacking, the player must have a square available to land the bomber after the attack.
He then declares his target, and rolls on the Nuclear Attack Complication table.
If still allowed after the roll, the attack continues….
AA guns fire—a hit on all attacking bombers aborts the attack.
The bomb explodes—the target territory must remove five military units, chosen by the defender. Any remaining air units lose their next turn due to the electromagnetic pulse.
The territory under attack decreases in value by one credit for one round, to a minimum of zero.

Other considerations:

- **Conventional and nuclear attacks cannot coincide on any land or sea territory!** Non-combat moves through a recently bombed sea zone are permissible, however.
- Only one bomb may be built per country per turn.
- Bombs may be stockpiled from round to round.
- If the territory containing a nuclear weapon is captured, so is the weapon.
- Bombs may only attack via bomber until the advent of ballistic missiles.
- Ballistic missiles must still avoid anti-aircraft fire to strike their target.
- If the territory under nuclear attack contains an atomic bomb, it may detonate (a roll of "1" on the die), adding its power to the original blast.

Atomic Bomb Complications:
Protests: Demonstrations at major universities prevent deployment of the bomb this turn. The USSR may ignore this result.

Malfunction: The bomber flies to the target, risking AA fire (if present), and drops the bomb, only to discover that the weapon is a dud.

Detonation: A rare and devastating complication, premature detonation of the bomb acts precisely as if the bomb was dropped on the attacking territory. Further, any other bombs stored in that zone will also detonate, adding their power to the original blast. Finally, the emotional shock of a nuclear accident prevents any further atomic bomb construction or attack on this and the subsequent round. The USSR may ignore this last restriction.

International Hostility: As the atomic bomb primarily targets civilians and civilian institutions, international response to the use of nuclear devices is often negative. This result comes in four varieties:

- **Chinese Log Formal Protest**: This shifts Chinese alignment one space from your country and toward the enemy.
- **Arab League Denounces Nuclear Strike**: Arab opinion is shifted toward your enemy.
- **South American Nations Appalled at Loss of Life**: The OAS moves away from your alliance.
- **Global Outrage Expressed at Atomic Blast**: All three of the major neutral powers (the Chinese, the Arab League, and OAS) shift their allegiance toward your enemy.

Dice Table of Nuclear Complications (roll two dice and add the result):

Roll	Result
2	Detonation
3	Malfunction
4	Arab Outrage
5	Chinese Outrage
6	Normal Attack
7	Normal Attack
8	Normal Attack
9	Campus Protests
10	OAS Outrage
11	Chinese Outrage
12	Global Outrage

Spies

Spies are the undercover agents of war. Despite their non-violent methods, spies provide information crucial to victory. In this game, the spy functions as a diplomat to undecided neutral nations, as an "information-gatherer" stealing enemy technologies, and as a counter-intelligence officer attempting to thwart enemy spies. These methods are outlined as follows:

Diplomacy: A spy may be assigned to influence a neutral country or neutral alliance (i.e. the Arab League). For each spy assigned to the task, the player rolls a die. Each "1" rolled shifts a neutral country toward the player's alliance. For individual neutrals (e.g. Ireland) success means that the nation now flies the flag of the player's nation, contributing its credit value and troops. If a spy successfully influences a neutral alliance, the influence token is moved one step toward the appropriate country.

"Sincere diplomacy is no more possible than dry water or wooden iron."—Iosef V. Stalin

Example: A British spy attempts to influence the Arab League and rolls a "1." The influence token is moved one step toward the NATO alliance. If this would result in money flowing to NATO, the Western European Alliance would still receive the benefits of Arab support, even though a British spy caused the influence shift.

Espionage: In the purest form of his art, a spy can directly acquire technologies from the enemy. For each spy assigned to "espionage," the player rolls a die. Each "1" rolled allows the player to acquire a technology for use the next round. Note that while the player can choose the category of information his spy retrieved, he may not "skip" technologies within a category.

Example: An American spy attempts espionage. If the USSR has both **heavy armor** and **anti-tank guns**, and the spying player has neither, then the spy may only purloin the **heavy armor** technology.

Counter-Intelligence: Because spies work alone and can disappear into the general population, standard military units are useless against them. However, by assigning spies to "counter-intelligence," a player may roll a die for each. Every "1" rolled destroys one enemy spy, which can be rebuilt on the following turn.

Additional Rules Regarding Spies:

- NATO countries may only purchase one spy per group. The US, Britain, and Western Europe can each buy one spy, and may replace it if it is lost.
- The USSR may buy two spies, and may replace them if lost.
- The police-state regime of the USSR allows an additional spying advantage: each turn, the USSR player may roll a free counter-intelligence attempt to destroy a NATO spy, in addition to any actions by the other two Soviet spies.
- Spies are never placed on the regular game board. They are kept in the Spy box on the edge of the board, and their actions are designated according to their player's wishes in the "Spying" phase of each turn.

Technologies

Technologies can be researched by any of the major powers. They can also be acquired by spying efforts as outlined under "Spies."

To pursue a certain line of research, a player declares that his country is attempting to research a particular field. He returns 5 credits to the bank, and rolls a die. If the result is a "1," that country has acquired the next higher technology in the field (represented by the numbered diamonds in the "Technology" section of the board), and may begin using it immediately. If a "2" is rolled, the player has not discovered the technology outright, but has made a major breakthrough and moves his technology counter halfway to the next technology (the small circle between the numbered diamonds). The player need now roll a "1" or "2" to discover the next technology.

If the player's marker rests on a circle, and he rolls a "1," then the marker is moved **two** spaces to the next circle.

The powers of the NATO alliance may share technology, limited as follows:

- Nuclear technologies may not be shared.
- Sharing requires the consent of the player with the technology.
- Sharing allows only a "half-step" toward the next technology, i.e. if the US player possesses submarine snorkels and decides to share with the British player, who has not researched submarines at all, then the British player gains the equivalent of a major breakthrough. Any subsequent attempts to develop snorkels will succeed on a roll of "2" or less. Likewise, if the British player already had a major breakthrough, then he could gain the technology outright through sharing. However, if the US had both snorkels and nuclear power, the US player could only share nuclear power technology once the British player had achieved snorkels.
- Only the first NATO player to gain a technology may share it with the others, i.e. if the US shares as above, granting the British and Western Europeans a major breakthrough, the British could not then develop snorkels and grant another half-step to the Western Europeans.

Submarine Technologies

Snorkels: As the Allies invaded further into German territory, they discovered advanced prototypes with long snorkels, enabling the subs to "breathe" (i.e. exchange diesel exhaust and power their batteries) without fully surfacing.

Benefits: Subs may move freely in all ocean squares, even those containing enemy ships. In addition, fighters and bombers may no longer attack submarines.

Nuclear Power: In the early 1950's, American naval officers, led by Hyman Rickover, pursued portable nuclear power plants as a way to provide unlimited power and range to a submarine. This was later applied to aircraft carriers and cruisers.

Benefits: Subs move three spaces per turn instead of two. In addition, they may traverse the Arctic Ocean…i.e. a sub can enter the polar cap if it starts from any adjacent square and emerge at any other adjacent square, using the submarine's entire move in the process. A submarine may seek shelter under the polar ice, with the following restriction—either the first or the last sea zone in the sub's movement must be in open ocean. This allows a nuclear sub to spend only one turn under the ice before it is forced to leave. While hidden under the pole, a submarine may only be attacked by other nuclear submarines.

Example: The *USS Nautilus* travels north through the Bering Strait and ends its turn under the polar ice. On the next turn, the vessel emerges in the Barents Sea.

Cruise Missiles: Allied commanders were continually impressed with German ingenuity, and eventually were able to adapt the German V-1, or "buzz bomb," for use at sea. The first such were the American submarine-launched Regulus missiles. As recently as the Persian Gulf War, similar missiles (Tomahawks) were used to bombard land-based targets.

Benefits: Subs may participate in amphibious assaults in the same manner as battleships and cruisers, attacking at a "2."

Nuclear Technologies

Fission Bomb: Inaugurated in the late days of World War Two via the Manhattan Project, the first atomic bombs ("Fat Man" and "Little Boy") ended the Japanese defensive effort and spared countless American lives. The US begins the game with this technology.

Benefits: The player may use and deliver atomic bombs as described previously.

Ballistic Missiles: The German V-2 rocket was the prototype for all missile technology until about 1950. In fact, the dwindling supply of captured V-2s provided American scientists with incentive to begin developing their own missiles capable of delivering payloads hundreds of miles.

Benefits: Atomic weapons may be launched up to three spaces from an AA gun. No bomber is required for deployment. One bomb may be launched per AA gun on any given turn.

Fusion Bomb: "I am become as death, the destroyer of worlds." So said J. Robert Oppenheimer, quoting the *Bhagavad-Gita* as he witnessed the first explosion of a hydrogen bomb. The power of these devices dwarfed the uranium and plutonium bombs previously developed—the Pacific islands used as testing grounds for these weapons were literally vaporized.

Benefits: Atomic weapons are at double strength (destroying ten enemy units), and reduce a territory's value by two credits for one round. Note that a player may choose to deploy fission weapons instead.

Aircraft Technologies

Jet Propulsion: In their continual hunt for a secret weapon to turn the tide of the war, German scientists developed and produced the Messerschmit 262, the first true jet aircraft. Amazed by their first views of this technology, Allied researchers refined and improved the original design.

Benefits: Fighters defend at a "5."

Long-Range Aircraft: Over time, planes began to fly farther and higher through more efficient design. These efforts ultimately culminated in the U-2 spy plane, which flew at sub-orbital altitudes and across entire continents.

Benefits: Fighters can move six spaces per turn; bombers move eight.

Helicopters: First envisioned by Leonardo da Vinci, helicopters could shuttle troops and equipment rapidly around a battlefield, and provide air support in forward locations.

Benefits: Fighters may act as transports, carrying one infantry each. They may also land in newly captured territories (extending their range), but defend at a "0" if attacked before their next turn. The fighter may not participate in combat if is used as a helicopter, and it is still subject to anti-aircraft fire.

Armor Technologies

Heavy Armor: By the end of World War Two, the warring powers had increased the size and armor of their tanks. British and American leaders shuddered at the sight of huge Soviet IS-3 tanks in the Berlin victory parade. The USSR begins the game with this technology.

Benefits: The player may purchase heavy armor units, as described above.

Anti-Tank Guns: In the race to keep up with the massive tank armies of the Soviet Union, NATO leaders designed "tank-killers"—artillery pieces with armor piercing rounds.

Benefits: When a space containing an Anti-Aircraft Gun is attacked, the defending player may designate either tanks or planes as the intended target. Prior to the first round of combat, a die is rolled for each attacking tank; each "1" rolled destroys an enemy armor unit.

Self-Propelled Artillery: Slow-moving artillery pieces became increasingly vulnerable to aircraft. To keep up with advancing tank platoons, the Allies built artillery pieces on treads. These weapons were quite expensive, and vulnerable to attack at close range.

Benefits: The player may build special AA Guns designated as self-propelled artillery. The weapons move two spaces, attack at a "4", defend at a "1", and cost 4 credits. They may not blitz.

Neutral Alliances

In the aftermath of World War Two, independent countries began to band together into tight alliances to better serve their own interests. Two of these unions were the NATO alliance, formed in 1949, and the opposing Warsaw Pact, created in 1955. These unions merely formalized relationships existing since the war's end. In addition to these powerful groups, several regional organizations formed, essentially independent of the global superpowers.

To set up the influence board, place the appropriate marker on the circle outlined in black (place the Chinese marker on the red "4," for example.)

China: Fragmented by the colonial intent of European and Japanese conquerors, China began to achieve a new unity in the wake of World War Two. By 1948, insurgent Communist forces under Mao Zedong had seized control over most of the country, with the autocratic Nationalist rulers clinging to several large eastern cities. Because of this strong Communist faction, China starts the game favoring the Soviet Union (place the marker on the "4" on the influence board.) If cajoled into favoring NATO, however, the Chinese will benefit the British, based on centuries of historical ties between the two countries (e.g. Hong Kong.)

"Political power comes from the barrel of a gun"—Mao Zedong

Organization of American States (OAS): The founding of the OAS in 1948 provided new unity for Latin American countries attempting to stabilize themselves. Although steering clear of major world involvement, the OAS starts the game favoring the NATO alliance (one step left of center on the influence board). When supporting NATO, the OAS will funnel funds through the United States (actually a member of the OAS, and the dominant power in the Western Hemisphere.)

The League of Arab States: Freed of centuries of European economic domination, several Arab states banded together in 1947 to attempt to reunify Islamic culture. This union of spirit has persisted intact in the subsequent half-century. The Arab League begins the game in the position of true neutrality. If swayed to the side of NATO, the oil-rich League will fund the Western European forces.

Minor Neutrals: Countries that remained free of major obligations immediately after the war were often persuaded to join one of the major powers later in the twentieth century. These countries will join as noted in "Spies." If a major power succeeds in convincing a minor neutral to join it, then all forces in that territory are reassigned to the new leader and may be **used on that round of play**. Also, because "Spying" occurs before "Purchase Units," new infantry may be placed on the territory at the end of the round.

Rules for neutral play:

- If attacked and not completely conquered, neutral countries will join the opposite side, banding with the power nearest to them. If a neutral alliance is attacked, all remaining countries in the alliance permanently join the opposite side, and major power replaces all neutral units with its own.
- Neutral alliances do not directly enter conflicts unless attacked. Instead, they contribute income to one side or the other depending on the strength of commitment—one-fourth, one-half, or all of the alliance's value depending on the position of the influence marker.
- Any time a neutral alliance is contributing credits to one side, then that major power may move troops freely through the neutral territory. Note that this can be tenuous, however…if the influence of that power wanes to below the level required, all troops are unceremoniously thrown out of the neutral alliance to an adjacent territory, or to the power's capital if no adjacent territories are available.

  Example: The Soviet Union, beginning the turn on receiving an income of "4" from the Chinese, plans to stage an assault from western China into British territory. The Soviet player then moves troops into Sinkiang in position for an attack on Pakistan. However, later in the round, the US rolls to influence China, and succeeds. The Soviet troops are moved from Sinkiang back to Russian territory.

- The USSR may attack any neutral country at any time. NATO may only attack a neutral alliance if it is providing **full** income support to the Soviets (16 credits for China or 12 for the Arab League or OAS).
- Exception to the above rules: if the USSR is receiving income from China (as at the beginning of the game), the Soviet player may move up to six Chinese troops from Manchuria to garrison North Korea, thus effectively blocking NATO movement into North Korea. The number of Chinese troops in North Korea may never exceed six at any one time. The Chinese **may only fortify the Soviet position**, not attack. Chinese forces in North Korea return to Manchuria if Chinese support diminishes to below "4". Chinese troops moved out of Manchuria in this way are automatically replaced at the end of every turn on the Soviet "place units" phase. Therefore, at the start of the Western Europe turn, China will always have eleven infantry in Manchuria, regardless of the number in North Korea.
- The Suez Canal is off limits to any player not in good standing with the Arab League (i.e. at least the center of the influence table). Therefore, both the USSR and the NATO powers may move freely through the canal at the start of the game, but any shifting of Arab allegiance will bar one side. As a military alternative, if a player conquers **both** Egypt and Jordan, then he and his allies may move ships freely through the canal.

Tips for Play and Setup

Because this game features a variety of countries and units, we have several suggestions for representing different pieces if the provided units are insufficient:

- Use red pieces for the USSR, gray for Western Europe, tan for the British, and green for the United States.
- Use the yellow pieces to represent all neutral countries and alliances.
- To represent heavy tanks, use the pieces provided with this game, which are a slightly different color than the original units.

To aid setup and facilitate game play, we have found several helpful tips:

- Do not set up neutral units unless they are actually needed.
- During battles, multiple dice of different colors can be used to decide the outcome quickly. For example, white dice can represent infantry and red represent tanks. Of course, this designation must be perfectly clear to all players **before** the dice are rolled.
- Roll units from strongest to weakest.
- Large groups of units can be signified by a control marker, which can be moved in lieu of an entire fleet or army. The units are placed to one side of the board.
- If any rule is unclear, remember that the point is to have fun. Invent a replacement rule that is consistent and fair, and realistic if possible.

Rule Variations

Spy Versus Spy:

All spy rolls succeed on a "2" or less. In addition, each country may build twice as many spies as noted in the regular rules. Further, **all** one-point territories are subject to influence rolls. For example, the British player attempts to influence the Baltic States. If successful, any Soviet troops are expelled, and a single British infantry is placed on the territory.

Nuclear Winter:

The restrictions on atomic weapons are lifted (no rolls must be made to successfully attack a target). The cost is cut to 10 credits, and players may build as many bombs every turn as they can

afford. In this variant, the Soviet Union begins the game with the "Fission Bomb" technology.

Tech War:

Technology rolls succeed on a "2" or less, and a major breakthrough occurs if a "3" or "4" is rolled. The following additional technologies are made available:

Ship Technologies:

1) *Heavy Transports*: Players may build special transports, costing 10 credits. These can carry any of the following—three infantry, two infantry and one tank, two tanks, or one heavy tank and one infantry.
2) *Nuclear Carriers*: Larger carriers with unlimited range. They can support three fighters or one fighter and one bomber. They move 3 spaces, and cost 20 credits. Attack and defense are as usual.
3) *Advanced Radar*: All cruisers are fitted with advanced radar, which provides an automatic "AA Gun" type defense against air attacks before the first round of attack. Only one such defense roll is possible, even if multiple cruisers cooperate in a fleet.

Infantry Technologies:

1) *Special Forces*: Elite combat units. Special forces cost 6, attack at 2, defend at a 3, move 2 spaces, and get a sneak attack, which is exactly as described for submarines. Special forces may blitz.
2) *Marines*: Specially trained for amphibious landings. All infantry participating in amphibious assaults attack at a 2 for the first round only.
3) *Jeeps*: Highly mobile troop carriers. Infantry may move up to three spaces on **non-combat only.**

12	Global Outrage

APPENDIX B: Unit Costs & Characteristics

Unit	*Attack*	*Defend*	*Move*	*Cost*	*Comments*
Infantry	1	2	1	3 (2)	Infantry cost 2 credits for the USSR
Armor	3	2	2	5	May “blitz” unoccupied enemy territory
Heavy Armor	4	3	2	7	May blitz
Anti-Aircraft Gun	1	--	1	5	Attacks on first round, fighters only. AA Guns are captured with the territory
Self-Propelled Artillery	4	1	2	4	--
Fighter	3	4	4	12	Lands on carrier
Bomber	4	1	6	15	May transport one infantry
Transport	0	1	2	8	Transports 2 infantry or 1 armor or 1 A-bomb
Submarine	2	2	2	8	Units hit by attacking subs may not counterattack; subs may retreat from battle on attack or defense
Cruiser	2	3	2	12	Bombards shore targets at a “2”
Carrier	1	3	2	18	Transports 2 fighters
Battleship	4	4	2	22	Requires two hits to destroy; bombards shore targets at a “4”
Industrial Complex	--	--	--	15	Required to produce units other than infantry
Atomic Bomb	∞	--	1	20	May move via bomber
Spy	--	--	--	10	Placed on Spy Table; remains until destroyed by enemy spy
